

# What is an article revision?

## Build your help center

An article revision is a saved version of an article that keeps track of the changes made during its creation or editing process. Every time you make a change to an article - be it to the title, the content, the author, the category, the status, or the visibility settings - and save it, a new revision is created.

Revisions allow you to monitor the edit history of your articles, compare different versions, and even revert to a previous version if needed. This is particularly useful in collaborative environments, where multiple contributors may work on the same article, as it provides a clear record of who made which changes and when.

Therefore, the revision system in your [HelpCenter.io](#) dashboard is a powerful tool for managing your content effectively, ensuring accountability, and maintaining the highest quality standards for your knowledge base articles.
